20. ABSTRACT (Continue on reverse side if necessary and identify by block number) This volume contains the description and instructions of the use of Sharp PC-1500 Pocket Computer for the key calculations of the stiffness and strength of symmetric laminated composites. Instant calculations can be made for practical use. The formulas and equation numbers used in the performed programming have been derived from a book entitled, <u>Introduction to Composite Materials</u> , co-authored by S. W. Tsai and H. T. Hahn, published by Technomic Publishing Company, Westport, CT, July 1980.

FOREWORD

This report was prepared in the Mechanics and Surface Interactions Branch (AFWAL/MLBM), Nonmetallic Materials Division, Materials Laboratory, Air Force Wright Aeronautical Laboratories, Wright-Patterson AFB, Ohio. The work was performed under Contract F33615-82-C-5001; SB5448-82-C-0086.

The time period covered by this report was from June to December 1982. Dr. Won J. Park was a senior scientist from Universal Energy Systems, Inc. and Professor of Mathematics and Statistics at Wright State University.

Dr. Thierry N. Massard was a visiting scientist at Materials Laboratory, Air Force Aeronautical Laboratories, Wright-Patterson AFB, Dayton, Ohio, and a Chief engineer at the Commissariat L'Energie Atomique, Montrouge, France.

The equations and table numbers which appear in the flow charts are the same as in Introduction to Composite Materials, co-authored by S.W. Tsai and H.T. Hahn, published by Technomic Publishing Company, Westport, CT, in July 1980.

Those who want to receive the programmed magnetic cassette tape should contact Stephen W. Tsai, AFWAL/MLBM, Wright-Patterson AFB, Dayton, Ohio 45433, Tel: 513-255-3068.

IV	CONCLUSION	32

SECTION I
USER GENERAL INSTRUCTIONS

- (1) The program language for PC-1500 Pocket Computer is BASIC and the elementary part of BASIC program instructions are given in the SHARP Instruction manual, which comes with PC-1500 Pocket Computer.
- (2) The 8 K RAM should be attached to the computer to increase its capacity. Printer is necessary for Version 1 and 2. If not available, choose Version 3 of the program.
- (3) The programs are called SYM-LAM 1, SYM-LAM 2, and SYM-LAM 3. They are three different displays of the same calculation:

SYM-LAM 1 (Version 1) gives vertical printing on the paper,

SYM-LAM 2 (Version 2) gives horizontal printing with matrix form
on the paper,

SYM-LAM 3 (Version 3) gives results on the display window and
does not require the printer.

The programs are started in mode RUN by instruction RUN (press the keys **R** **U** **N** and **ENTER**). User is guided through the programs by simple questions. The user types the chosen answer and presses the key **ENTER** .

- (4) The programs are recorded on a magnetic cassette with tape counter readings:

SYM-LAM 1 : 0 - 200

SYM-LAM 2 : 250 - 400

SYM-LAM 3 : 450 - 540

Instruction CLOAD "SYM-LAM 1" ("SYM-LAM 2" or "SYM-LAM 3") is used to load the program from the cassette recorder to the computer.

- (5) The program considers only symmetric laminates of composite materials.

SECTION II

CONTENTS OF PROGRAMS

The program performs specific operations and computations of composite materials:

- (1) Description of the laminates.
 - number of angles
 - number of plies for each angle
 - number of core plies (for flexural stiffness of sandwich plate only)
- (2) In-plane stiffness of symmetric laminates.
 - modulus and compliance
- (3) Engineering constants.
- (4) Normalized in-plane stiffness.
 - modulus and compliance
- (5) In-plane strength.
- (6) Stress failure envelope.
- (7) Strain failure envelope.
- (8) Flexural rigidity of symmetric sandwich plates.
 - modulus and compliance
- (9) Flexural strength of symmetric sandwich plates.

REMARKS:

- (a) The materials constants are stored in the program. When

REMARKS: (cont'd)

"MATERIAL N. =" is asked, input the material number or press M,
which gives the menu for materials numbers:

- 1 - T300/5208
- 2 - B(4)/5505
- 3 - AS-3501
- 4 - Schotchply/1002
- 5 - Kevlar 49/Epoxy

To add other materials (up to 10), user should type (in PRO mode)
for a material N. = x: (line 10 * x)

10 * x: DATA "Name of Material", E_x , E_y , ν_x , E_s , h_o , X, X',
Y, Y', S: RETURN

An example of adding a new material (Aluminum-material number 6)
is as follows:

Set PRO mode, write 60 DATA "ALUMINUM", 69E3, 69E3, .3, 26.5E3,
.125E-3, 400, 400, 400, 230: RETURN and press ENTER .

The unit of engineering constants are in MPa and thickness is in
meter.

(Do not forget to save the modified program on the cassette tape
using instruction CSAVE "SYM-LAM1" ("SYM-LAM2" or "SYM-LAM3"). The
menu is set automatically up to date.

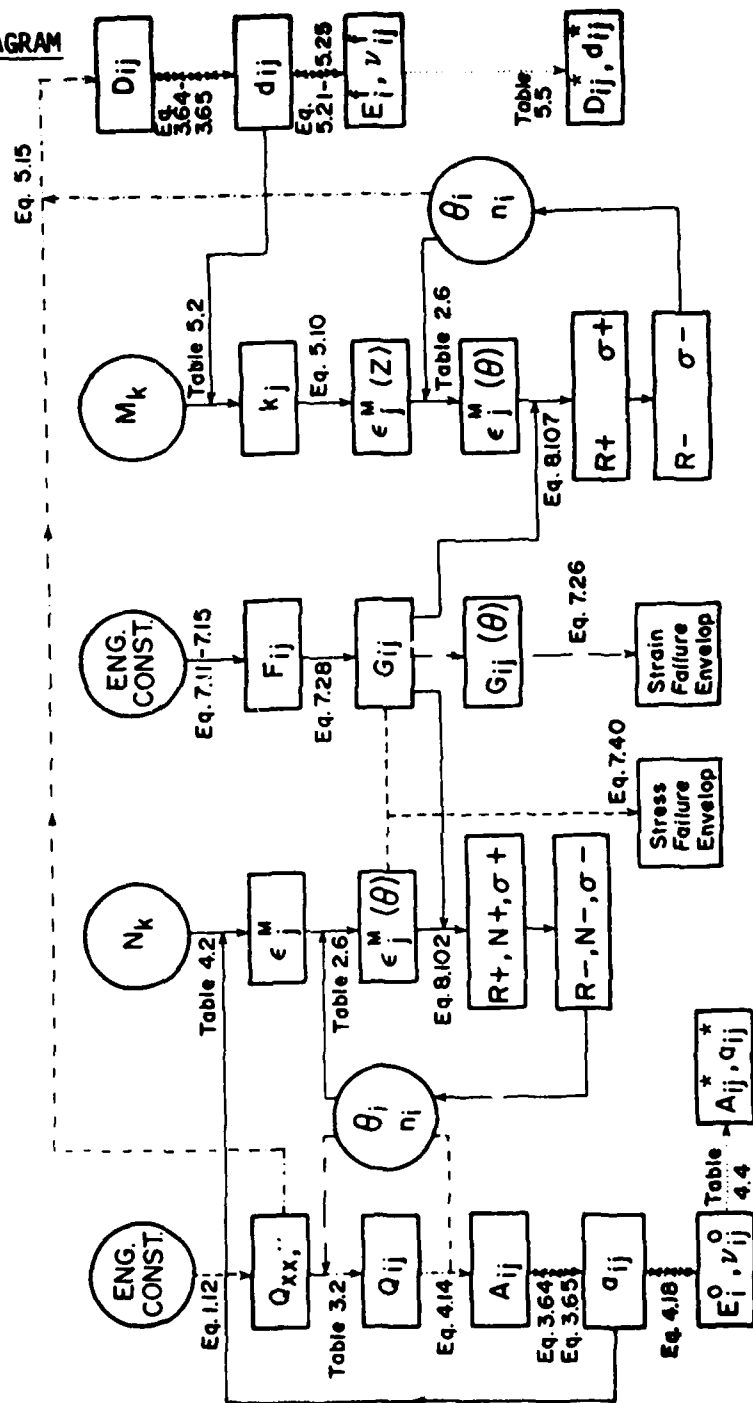

- (b) The order of angles to be entered starts from the angle closer to the mid-plane. This is very important in the flexural rigidity and strength computations.
- (c) The value of F_{xy}^* was programmed as $0 = -\frac{1}{2}$ in the program step 1025. For $F_{xy}^* \neq -\frac{1}{2}$, the new value should be entered directly in the program at this step (mode PRO).

SECTION IV

CONCLUSIONS

The description and instruction of the use of Sharp PC-1500 Pocket Computer for the key calculations of the stiffness and strength of symmetric laminated composites are presented in this paper. With the computer packages that were programmed, instant calculations can be made for practical use.
